

ResNet 与 DenseNet

主讲：龙良曲

ResNet

- The residual module
 - Introduce *skip* or *shortcut* connections (existing before in various forms in literature)
 - Make it easy for network layers to represent the identity mapping
 - For some reason, need to skip at least two layers

Kaiming He, Xiangyu Zhang, Shaoqing Ren, and Jian Sun,
[Deep Residual Learning for Image Recognition](#), CVPR 2016 (Best Paper)

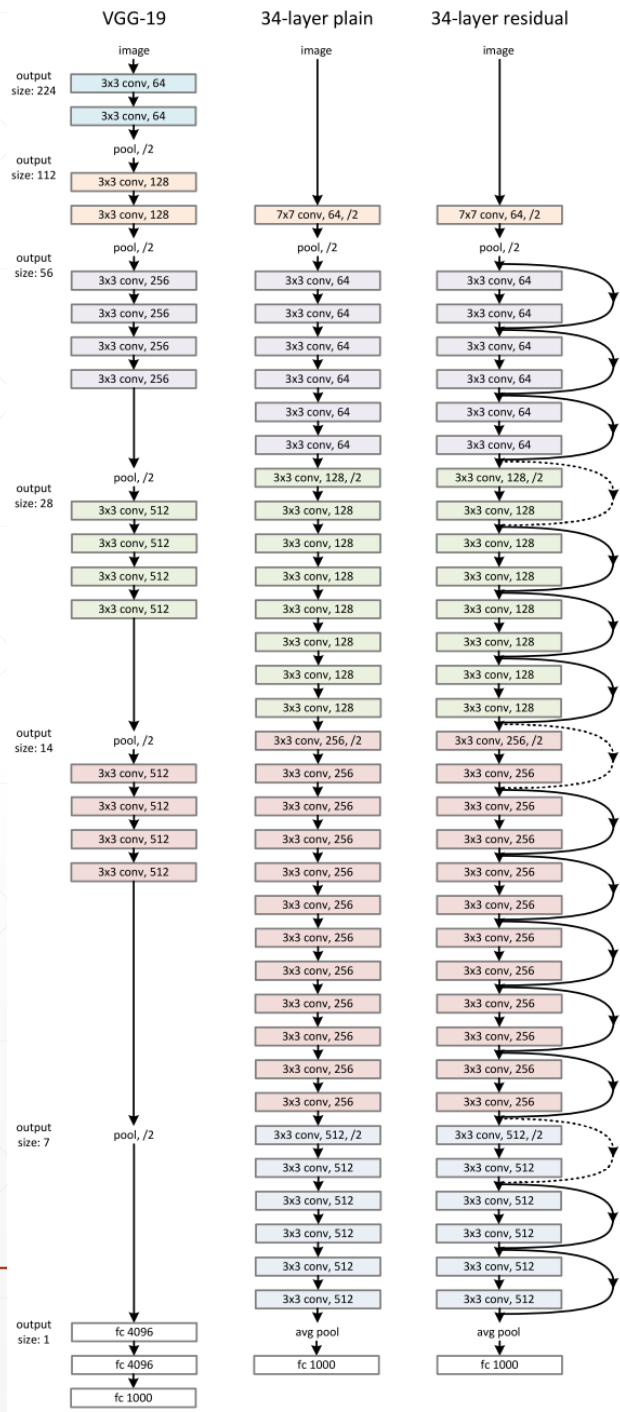

ResNet

Deeper residual module (bottleneck)

- Directly performing 3×3 convolutions with 256 feature maps at input and output:
 $256 \times 256 \times 3 \times 3 \sim 600\text{K}$ operations
- Using 1×1 convolutions to reduce 256 to 64 feature maps, followed by 3×3 convolutions, followed by 1×1 convolutions to expand back to 256 maps:
 $256 \times 64 \times 1 \times 1 \sim 16\text{K}$
 $64 \times 64 \times 3 \times 3 \sim 36\text{K}$
 $64 \times 256 \times 1 \times 1 \sim 16\text{K}$
Total: $\sim 70\text{K}$

ResNet: ILSVRC 2015 winner

Revolution of Depth

AlexNet, 8 layers
(ILSVRC 2012)

VGG, 19 layers
(ILSVRC 2014)

ResNet, **152 layers**
(ILSVRC 2015)

Kaiming He, Xiangyu Zhang, Shaoqing Ren, and Jian Sun,
[Deep Residual Learning for Image Recognition](#), CVPR 2016

BOOM!

Microsoft
Research

MSRA @ ILSVRC & COCO 2015 Competitions

- **1st places in all five main tracks**

- ImageNet Classification: *"Ultra-deep"* (quote Yann) **152-layer** nets
- ImageNet Detection: **16%** better than 2nd
- ImageNet Localization: **27%** better than 2nd
- COCO Detection: **11%** better than 2nd
- COCO Segmentation: **12%** better than 2nd

*improvements are relative numbers

Kaiming He, Xiangyu Zhang, Shaoqing Ren, & Jian Sun. "Deep Residual Learning for Image Recognition", arXiv 2015.

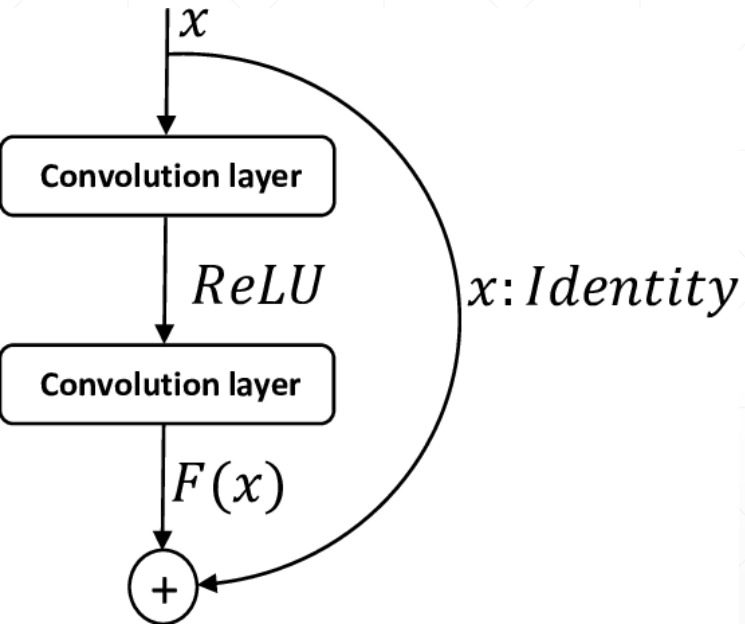

Why call Residual?

$$\mathcal{F}(x) := \mathcal{H}(x) - x$$

Basic Block

```
class BasicBlock(layers.Layer):
    def __init__(self, filter_num, stride=1):
        super(BasicBlock, self).__init__()

        self.conv1 = layers.Conv2D(filter_num, (3, 3), strides=stride, padding='same')
        self.bn1 = layers.BatchNormalization()
        self.relu = layers.Activation('relu')
        self.conv2 = layers.Conv2D(filter_num, (3, 3), strides=1, padding='same')
        self.bn2 = layers.BatchNormalization()
        if stride != 1:
            self.downsample = Sequential()
            self.downsample.add(layers.Conv2D(filter_num, (1, 1), strides=stride))
            self.downsample.add(layers.BatchNormalization())
        else:
            self.downsample = lambda x: x

        self.stride = stride

    def call(self, inputs, training=None):
        residual = self.downsample(inputs)

        conv1 = self.conv1(inputs)
        bn1 = self.bn1(conv1)
        relu1 = self.relu(bn1)
        conv2 = self.conv2(relu1)
        bn2 = self.bn2(conv2)

        add = layers.add([bn2, residual])
        out = self.relu(add)
        return out
```

Res Block

```
def _build_resblock(self, block, filter_num, blocks, stride=1):  
    res_blocks = keras.Sequential()  
    res_blocks.add(block(filter_num, stride))  
  
    for _ in range(1, blocks):  
        res_blocks.add(block(filter_num, stride=1))  
  
    return res_blocks
```

ResNet-18

DenseNet

\oplus : Element-wise addition

\oplus : Channel-wise concatenation
